About DiData

Di-LIMS has an easy to use interface for your samples and associated data, making it possible to assign barcodes, print labels, and track samples. Our LIMS system has a comprehensive audit trail for full compliance also known as a chain of custody, granting security and usability of your different assets, including laboratory and test data.

Our mission

DiData's lims solution has an intuitive workflows editor that allows to configure and replicate any laboratory workflows in Di-LIMS without the need for any IT trained staff. Lab members will be guided step by step to ensure high quality and optimized data input for optimal samples test results.

Our vision

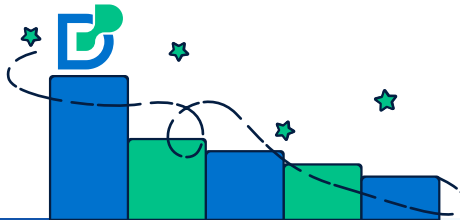

DiData's objective is to provide high-tech healthcare data management solutions regardless of the user's IT background. We believe that a tailored tool in the right hands is key for research breakthroughs and would open the door to new opportunities. From the early stages of DiData, we collaborated with medical doctors and scientists to ensure that our environment provides a great user experience and cutting-edge IT solutions to tackle their challenges.

Our story

Research projects have significantly increased during the last decade, and so have their IT requirements. In parallel, digital technologies have shown tremendous improvements. However, researchers are still provided with software solutions based on old technologies which do not address new challenges nor offer a user-oriented experience. DiData's two co-founders encountered this frustrating situation during their extensive experience in both industry and academia. After obtaining their master's degree in bio engineering from the EPFL, the co-founders' Riad Gacem and Anass Chikhi took different directions: digital healthcare technologies and academic research. Nevertheless, during their long philosophic discussions to make a better world, one problem always kept intriguing; why is there such a knowledge gap between IT advances and researchers' solutions? Thus, they decided to create a research-driven solution and use cutting-edge technologies to address today's needs and tomorrow's challenges adequately.

LOGO

Logo balancing

Creating balance in a logo comes in many methods, symmetry, fibonacci sequence, grid method...etc

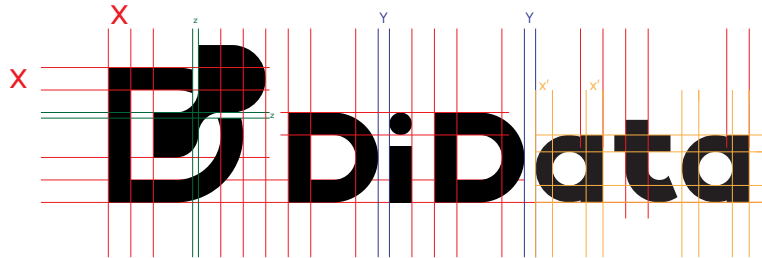

in the grid method, measurements are not random, the decided measurement is an element from the design itself called a control value, it is usually advised to take the smallest element (its height or width) and scale the logo accordingly. For didata here are the measurements used:

$X = i$'s dot height

$Y = x/2$

$Z = y/2$

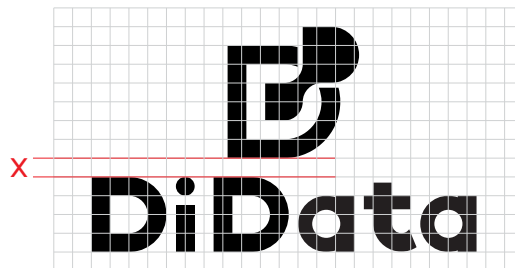

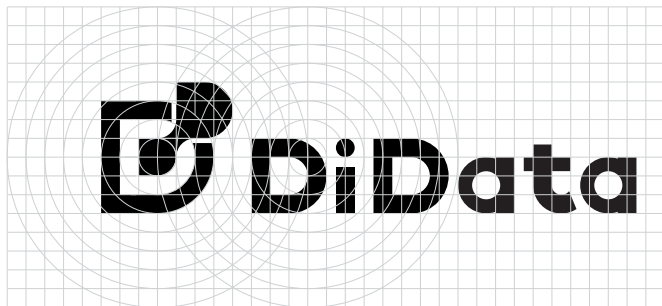

$X' = y + z$

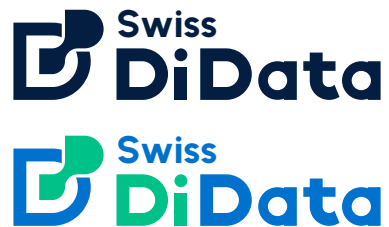

LOGO

Safe zone

Whenever you use the logo, it must be surrounded by a clear space to ensure its visibility & impact. No graphic elements should invade this area.

LOGO

Minimum sizing

To ensure that our logo remains clear and legible across different applications and platforms. The minimum size has been set to

Print

20 mm

15 mm

6 mm

LOGO

Usage on backgrounds

By placing the Didata logo on a background, we must maintain a significant level of contrast with the context for clarity and visibility. The examples illustrated on these pages shows optimal variables of our brand.

LOGO

Logo misuse

Whatever its use, the logo cannot be modified or adapted outside the brand guidelines. Several cases of prohibitions are presented.

Do not crop the logo

Do not change transparency of the logo

Do not shuffle around the colors of the

Do not use different colors

Do not alter the spacing between the logo elements

Do not use drop shadow

Do not change the size or position of the logomark and logotype

Do not distort the logo

Character Anatomy and posture

We build our human figures using an eight-head-high construct. This unit of measurement provides classical proportions yet offers you the flexibility to customize a figure. This structure is geometric and grid-aligned. the grid provides structure, adds more natural vitality with organic curves to express personality, style and character that's based on your story's requirements.
